## Time Is Valuable

*Kelly Truppo, Product Marketing Directory | Turbett Surgical*

Operating room time is more expensive than most.

Conventional estimates put its worth at \$100 a minute. So, saving those kinds of minutes makes a significant impact on budgets of hospitals and ambulatory surgery centers.

The use of multi-tray sterilization systems significantly decreases OR turnover time and helps conserve those precious minutes by making it possible to add an extra surgery per day in each room. The multi-tray sterilization container can be opened by one person in a matter of minutes, allowing your operating room nurses more time to focus on the patient.

Facilities have eliminated delays due to holes in blue wrap and see a significant time savings in both the operating room and sterile processing department.

In a time of staff shortages, doing more with less is a valuable skill.

When multi-tray rigid containers are used, fewer instrument sets are required since the sterilizing process is speeded up — another form of cost savings. With increased sterilizer throughput, instrumentation simply comes back faster and can be processed and used for another case that same day.

Everyone agrees that better turn-over time in the OR and sterile processing is good. But they may not understand the cost benefits of that saved time. It is also important to consider the value of staff satisfaction from not having to do the repetitive tasks of wrapping and unwrapping individual trays, and holding them as they are inspected.

With surgery caseloads rising, savings offered by multi-tray sterilization can yield significant value. A multi-tray sterilization system can even contribute to employee retention, given that the work is less strenuous.

Who wouldn't like their job to be simplified? Who wouldn't like to be more efficient at what they do? Who wouldn't enjoy a little extra time and space?

Those are just a few of the benefits that multi-tray sterilization systems offer.
