WORLD OF MEDICAL DEVICE MANUFACTURING PROCESS - PART 4 PRODUCTS

Pawel Szczygiel | Aesculap Technical Services

Quality Materials, Quality Products: The Original Equipment Manufacturer (OEM) should choose only medical grade stainless steel and similar materials in the manufacturing of surgical instruments. The choice of quality materials could play a key role in how the instrument will function and how will it hold up against environments that can often be found during use and in the reprocessing of medical devices.

Quality Products: The quality of the product may have a direct correlation on the product's performance. The surgeon and the Operating Room (OR) staff may find it frustrating that an instrument does not perform/function the way it should. In the OR environment, timing and performance can be very important. Hence the reason why only instruments that have been properly serviced and inspected should be used by hospital staff.

Quality Performance: Surgeons and OR staff can be faced with high expectations and can often operate under a lot of pressure. Using quality products can lead to quality performance resulting in an overall win for everyone. End-user satisfaction is an important part of the process.

Patient Care: In the end, all these quality factors, combined with end-user satisfaction, can have a direct and positive impact on the quality of patient care. Proper and quality patient care should be the focus of everyone in the medical industry. This is true not only for those who manufacture medical products but also for everyone in between, suppliers, service providers, hospital staff, and anyone who can have an impact on the patient's outcome.
